

Repeated Praise

One February day in 2017, the respected Comrade **Kim Jong Un** saw an equipment developed by scientists and technicians of the State Academy of Sciences.

After learning in detail about its features with more advantages than the imported one, he repeatedly said it was very interesting and touched it with his hands.

He said: After receiving a task of making the machine, the scientists and technicians of the State Academy of Sciences studied its photos and other relevant technical documents and manufactured it in less than a month. It is quite a wonderful thing, and their qualifications are amazing.

Expressing great satisfaction over the fact that the equipment has more functions than the one made in other countries and is better than that, he repeatedly praised the scientists and technicians for their great job.

Stressing the need to further improve the technical specifications of the equipment before its serial production and lower the production cost by increasing the proportion of relying on locally-available raw and other materials, he appreciated once again that the equipment was made in a short span of time.
